Vendor: CitrixExam Code: 1Y0-A21Exam Name: Basic Administration for Citrix NetScaler 9.2?QUESTION 1Which SNMP trap must an administrator configure to be informed when the response time for a monitor probe that had exceeded the set threshold returns to normal? A.   entityupB.   entitydownC.   monRespTimeoutAboveThreshD.   monRespTimeoutBelowThresh Answer: D QUESTION 2An administrator has executed the following commands:? enable ns feature lb? add service 11.1.1.1 HTTP 80? add service 121.1.1.2 HTTP 80? add lbvserver1 HTTP 1.1.1.3 80However, the administrator notices that the virtual server state is DOWN. Which action must the administrator take to set the virtual server state to UP? A.   Set lbvserver vs1-state UPB.   Bind a mentor to the servicesC.   Setlb to vserver vs1-accessDown yesD.   Bind the two services to the lbvserver1 Answer: D QUESTION 3The expression "url == *.txt || res.http.header content-encoding == text/html" can be used for _____ and _____ actions. (Choose the two action types that correctly complete the sentence.) A.   cachingB.   compressionC.   content SwitchingD.   cache Redirection Answer: AB QUESTION 4An administrator is configuring a virtual server for encrypted traffic from clients that needs to be decrypted prior to being forwarded to the back-end servers.Which type of virtual server and service should the administrator configure? A.   SSL server and serviceB.   SSL_TCP virtual server and serviceC.   SSL_TCP virtual server and TCP serviceD.   STCP virtual server and SL_TCP service Answer: C QUESTION 5What can an administrator configure to perform a health check for a SVC1,which is transferring HTTPS traffic so that a probe is only sent when there is no traffic to the server? A.   an HTTP monitor with the secure parameter selectedB.   an HTTP monitor with the transparentparameter selectedC.   an HTTP-Inline with the secure parameter selectedD.   an HTTP-ECV with the transparentparameter selected Answer: C QUESTION 6Which trap can an administrator set on a NetScaler system so that an alert is sent whenever an SNMP management application that does NOT have access privileges attempts to access a NetScaler? A.   loginFailureB.   accessFailureC.   accessDeniedD.   authenticationFailure Answer: D QUESTION 7Scenario: A network administrator working with two NetScaler systems has encountered an issuewithHA. The administrator notices that HA synchronization is failing. The administrator has already run the <show node> command on both nodes but needs more information.Which two additional steps should the administrator take to collect the appropriate data in order to troubleshoot this issue? (Choose two.) A.   Collect the files in /var/core.B.   Collect the files in /var/log/auth.log.C.   Run show techsupport from both NetScalers.D.   Run /netscaler/nstrace.sh -sz 0 to gather an nstrace. Answer: AD QUESTION 8Scenario: An administrator finished installing a NetScaler appliance and configured a load balancing virtual server that has four services bound. The configured toad balancing method for the virtualseveris set to use least connection. The administrator later added a fifth server to the virtual server However, when testing load balancing, the administrator finds that the virtual server is using round robin instead of least connectionWhy would the NetScaler system be using round robin as the load balancing method instead of least connection? A.   The administrator did not save the configuration correctly.B.   The NetScaler is using slow start mode for the virtual server,C.   Least connection will only function when more than five servers are load balanced.D.   Least connection is not a load balancing method that can be used for Web servers. Answer: B QUESTION 9When leveraging the Dashboard, which information would indicate to an administrator that server performance has been improved after caching m a network environment? A.   Client connection count increasesB.   Server-side request rate increasesC.   Client connection count decreasesD.   Sever-side request rate decreases Answer: D QUESTION 10Scenario: An administrator has set up four Webserversfor toad balancing. The administrator wants to monitor the response codes from the site todeterminewhether the site is up. The administrator has bound a custom HTTP mentor to the WTTP services. When the monitor is bound, the services go down so the administratorunbinds the monitor to bring the state of the services to UP. The administrator runs a HTTP header trace and finds that the site is responding with a redirect.Which two options can the administrator use to get the service state to UP? (Choose two.) A.   Create a new HTTP monitor with a 200 response code and bind it to the service.B.   Create a new HTTP monitor with a longer response timeout and bind ft to the serviceC.   Modify the custom HTTP monitor with the same redirect response code the site is sending and bind it to the serviceD.   Modify the custom HTTP monitor with the HTTP request going to a page that responds with a 200 response code and bind it to the service. Answer: AC If you want to pass Citrix 1Y0-A21 successfully, donot missing to read latest lead2pass Citrix 1Y0-A21 dumps.If you can master all lead2pass questions you will able to pass 100% guaranteed. http://www.lead2pass.com/1Y0-A21.html
